## Mobile Press

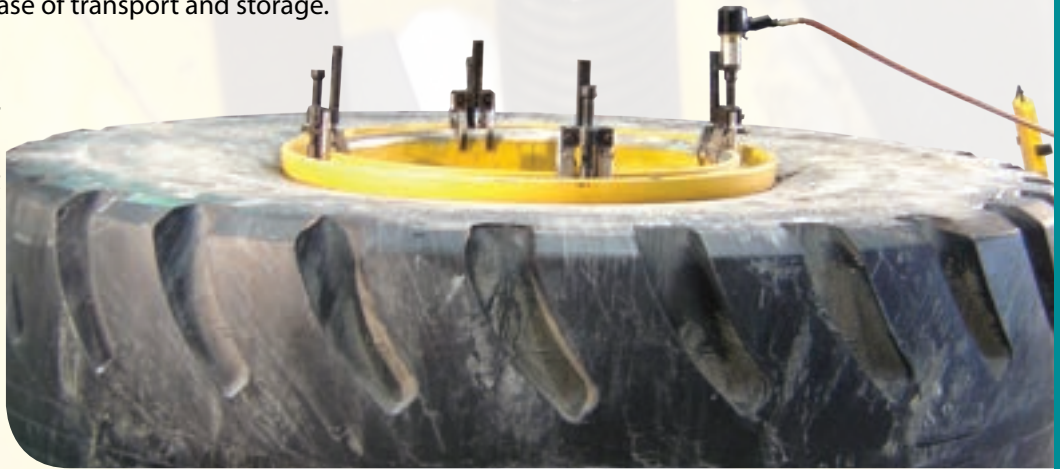

RIMEX presents the Mobile Press, a revolutionary portable earthmover tire press. The Mobile Press is engineered to easily remove an earthmover tire from its multi-piece rim. This unique process can be utilized in earthmover applications for 51" - 63" tire sizes.

### Key Features

- Inline trigger and regulator ensure safer working conditions for employees and equipment.
- Incredibly economical compared to a standard tire press.
- Easy to use—with proper training, any employee can operate the unit with ease and confidence.
- Packaged in rugged industrial case.
- Unique portable design for ease of transport and storage.

### How it Works

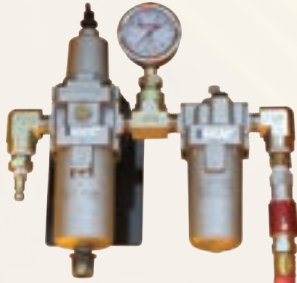

In this picture, there are four screw jacks (25-ton capacity each) attached to the rim's beadseat band. The single pneumatic torque wrench is moved from jack to jack, similar to torquing wheel nuts. As pressure is added to each jack, the total output is accumulative. In this situation, the Mobile Press is able to press up to 100 tons (25 tons per jack).

### Important Safety Features

The inline factory set regulator prevents the user from exceeding operational safety limits and ensures safe torque levels are met at all times.

The inline trigger is an integral safety feature of the Mobile Press system. It allows the unit to be operated from at least six feet away from the tire. The operator can control the system from a safe distance and may help to avoid serious injury.

### < 50-ton Mobile Press Kit

Includes two screw jacks, four universal jaw attachments and all require wrenches and allen keys. Additional 50-ton kits can be added to the system as required for increased pressing ability.
